About Me:

Worked at leading Russian companies. Served as the test lead for the team's features, developing a test model and improving e2e test stability. Implemented test user caching that made test runs 6 times faster and coordinated its adoption across teams throughout the company.

Work Experience (formal employment, documented in my employment record):

02.26-11.26: Avito Jobs - QA Engineer in a cross-functional product team (remote)

- Served as the test lead for the team's features, developing a test model based on the testing pyramid.
- Contributed to the launch of several large-scale A/B experiments, identifying issues that directly affected business metrics.
- Stabilized end-to-end (e2e) tests, particularly payment scenarios, reducing the flaky test rate to approximately 5%.
- Implemented test user caching in e2e tests, making test runs 6 times faster. This reduced time to market and made tests less dependent on infrastructure issues. Promoted the approach and coordinated its adoption across teams. The project subsequently expanded across the company, with adaptations for different business verticals.
- Identified issues in reliability metrics used by engineers across the company. This helped accelerate the transition to new metrics and eliminate false positives in monitoring.
- Configured canary releases for 8 microservices, introducing adaptive rollback thresholds.
- Used AI agents across all work processes and developed AI agent skills.

Tech Stack: **Postman, TypeScript, Go, Proxyman, Charles, DevTools, Atlassian**

06.25-09.25: Yandex Music - Developer in a backend product team (on-site)

- Increased test coverage by adding unit and automated end-to-end tests.
- Built geotargeting for the Music landing page from scratch, from design through implementation, testing, and rollout. The service's homepage content now varies by the user's city and can be configured through the admin panel.
- Contributed to migrating the content admin panel for tracks, albums, artists, and other content to a new technology stack, improving the user experience for content managers.
- Refactored the monolithic application.
- Was one of the first team members to use an AI agent for writing code.

Tech Stack: **Java Spring, MongoDB, JUnit, Mockito, Postman**

Achievements:

- Found a bug in the Telegram Wallet [Bug Bounty](#) program
